DEVICE TEST

1, Explain behaviour of hub device

- * Hub is basic networking device works at layer 1
- * Receiver data from one device (physical layer)
- * Broadcasts the data to all other ports
- * It does not check destination mac address
- * It creates collision domain
- * It works half duplex communication

2, Explain behaviour of switch device

- * Switch is an intelligence device
- * It will do address learning
- * It will do Broadcast and unicast
- * It is full duplex
- * When a data comes to a switch. The switch will do address learning it stores port num and mac ~~table~~ ^{add} in table. Then checks destination port num and mac address. If found unicast, If not found Broadcast

3, Explain behaviour of router device

- * It is used to break Broadcast domain
- * It is Layer 3 device
- * It will do unicast
- * It contains routing table
- * It is used to connect multiple different networks
- * It forwards a network from one network to another network

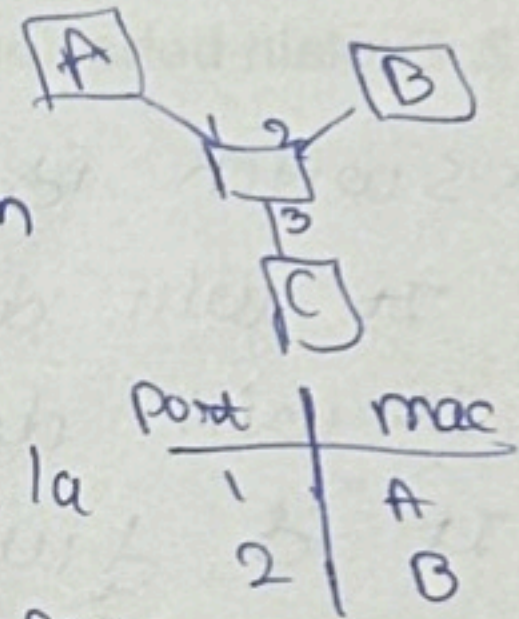

1) Hub: Hub is Layer 1 device Physical layer

all ports kum data va broadcast pannum and it's Bus topology concept and Half duplex it means A-B send pannum both B-A send pannum yesthu and Collision domain agum same time la anupam pothu 2 data um mothikum so data loss.

X ————— X

2) Switch:

osuk data Switch ku vantha address Learning pannum apdina do the port num and mac address note pannum and Then destination ku poa destination kum table la entry ivuntla unicast iland Broadcast pannum. It's Layer 2 device (Data Link Layer)

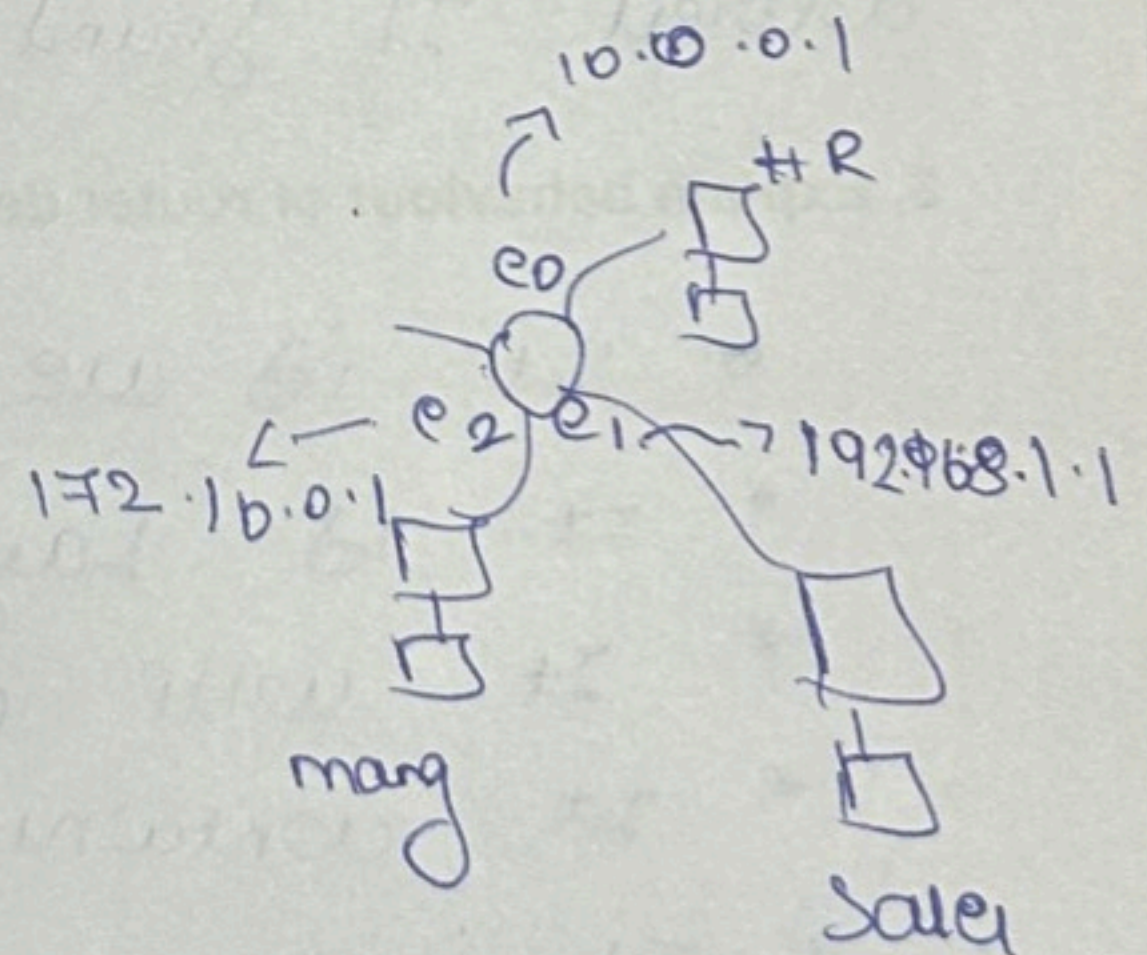

X ————— X

3) Router:

* osuk data router ku vantha ena pannum ra destination ip ku avaroda routing table la route istika nu pakum. Iyuntla unicast ilana drop

* different network la communicate pandalam

Routing table	
10.0.0.0/8	-> e0
192.168.1.0/24	-> e1
172.16.0.0/16	-> e2
